

# D.A.R.T. PRO

DATA ANALYSIS REPORTING TOOL

*Transform thousands of pages of data into usable, actionable intelligence, quickly and efficiently.*

Cases have become increasingly complex with the advent of digital media. Today, it's more likely that your suspect will be in possession of an advanced cellular device instead of a traditional personal computer. In fact, it's not uncommon for your cellular software to download thousands of pages of data from one of these advanced devices.

When multiple cellular devices are seized at once or over a period of time from a criminal organization, or even an individual, you need a fast and efficient way to transform this data into usable and actionable intelligence. The problem is that the data can often be overwhelming. *With this in mind, HTCI Labs developed D.A.R.T. to allow you to take control of your cases!*

## Features:

<p><b>Load Reports:</b> Load reports from multiple cell phone extraction tools including Cellebrite, Susteen, XRY, Android, Oxygen Forensics, AF Logical, HTCI's ART ripping tool, etc.</p> <p><b>Import Call Detail Records (CDRs):</b> Import call detail records from the service provider into DART for mapping AND Analysis.</p> <p><b>Analytics:</b> Correlates data from multiple reports. Watchlist, Shared images, GeoTagged images, Cross and Common Communications, SMS Conversations, Communication Grouping, and Timelines/Behavior Analysis.</p> <p><b>Global Contacts Management:</b> Build a detailed dossier on every contact. Includes aliases, photos, locations, organizations and affiliations, etc. in one easy to use record. Records can be used for comparison and analysis on reports and other DART cases.</p> <p><b>Organization Chart Builder:</b> Using the global contacts database, build a dynamic</p>	<p>organization chart. Link contacts, places, evidence photos all in one easy to use interface. Within the org chart, add notes and call-outs, edit organization specific contact details, and graphics. When the chart is finished, it can be printed or output to a detailed PDF report, including details on all chart items.</p> <p><b>Mapping:</b> Using Lat/Long, DMS, address, azimuth, LAC, Beam Width, and CDRs, plot tower locations, call details, range radii and pies, points of interest, locations, etc. Import GPS data too. Layers can be added, edited, and arranged, including notes, callouts, balloons, arrows, paths, images, and custom icons. Maps can be exported to PDF, XML, and KML files (for importing into Google Earth). Mapping can also be used offline!</p> <p><b>Bookmarking:</b> Make your case easy to present by bookmarking and annotating key sections of the analysis. Can be saved as an HTML and pdf file for easy presentation.</p> <p><b>Manual Case Entry:</b> Sometimes there is not a piece of forensic software available to rip a</p>	<p>phone or the phone is too damaged to extract data. Use manual case to create a report for these phones and add them to your case for analysis.</p> <p><b>Generate Forms:</b> Chain of custody, cell phone, and evidence forms can be generated right inside of DART. Information from your case will already be populated, saving you hours of time.</p> <p><b>Cell Phone Portal:</b> Find what features a phone has, what software will rip it, and any other information we have available.</p> <p><b>SIM Card Utility:</b> Import individual SIM cards into your case. Read and create copies of suspect SIM cards so you can safely perform forensic analysis on the cards and the phones.</p> <p><b>Investigator Portal:</b> All DART customers receive a one year subscription to the Investigator portal. The Investigator portal is a great online tool for digital forensic info.</p>

## *Our ART and Loader Tool have been added to give DART PRO Version 3.0 even greater capability!*

### **Android Ripping Tool Features:**

Have an Android device that you need to add to your analysis?

HTCI has developed the Android Ripping Tool (ART) for fast and easy extraction of data from your Android device. ART is a PC application that runs right from the desktop to your Android device, and saves the information to a user-defined folder on your PC. Specifically designed for use with the Data Analysis Reporting Tool (DART), the extracted data can then be easily imported into DART. ART can also be used with other applications that support XML imports.

**Standalone product:** ART is a standalone application that runs with administrator privileges from PC. ART requires that an Android phone is connected to the computer in debugging mode, and proper drivers are installed on the PC for the phone being extracted. Nothing needs to be put on the phone prior to extraction.

**Simple Interface:** ART's interface allows entered case and investigator information to be saved in the program. This case data becomes part of the XML files generated with the ART.

**Additional App Install:** ART can push install other applications onto the phone if desired.

**XML Output:** ART creates an XML file and folder structure that is designed to be imported into DART for analysis. The data can then be imported into other applications that support XML data.

### **DART Loader Tool Features:**

A fast and portable triage and sorting tool, LOADER gives the field investigator a single interface tool to quickly import a logical extraction in the field and determine the need to take the extraction further. LOADER has a severity coded watchlist that will show an immediate watchlist hit, or shared data with other reports loaded on the tool.

LOADER data can be exported directly into the Data Analysis Reporting Tool quickly and easily. Data can also be uploaded to any other applications that support XML imports.

**Standalone product:** LOADER is a standalone product that can be installed on a tablet or a MDT in the field where a full DART installation is not needed. LOADER can provide a fast and easy means of collecting data in the field.

**Watchlist:** LOADER can be pre-configured with a severity coded watchlist and normalized phone numbers so that any supported extractions loaded into the tool will show an immediate watchlist hit, or shared data with other reports loaded on the tool.

**Simple Interface:** LOADER's clean and simple interface allows for quick learning and use of the tool.

**XML Output:** LOADER creates an XML file and folder structure that is designed to be imported into DART for analysis. The data can then be imported into other applications that support XML data.

## **PRICED FOR YOUR BUDGET**

DART Pro v3.0 costs a fraction of what you've probably paid for analyst tools in the past, and provides significantly increased functionality. By being able to combine your reports into one tool, you'll save resources, time, and money. Compliment your DART software with a field data collection kit: A heavy duty canvas roll bag, containing a SIM card reader and 5 blank SIMs, a Faraday isolation bag, three USB thumb drives - one containing the DART software installer, one Operator Tool Kit USB, USB cables for microUSB, MiniUSB, iPhone4, and iPhone 5, tweezers, a 4-port USB hub, screwdriver, and four small storage boxes for SIMs, SD cards, or other small items.

*The most Impressive Cell phone report analysis tool EVER can be yours for only:*

# **\$1299.00**

\*Includes one year support and maintenance, this means that you can upgrade to the latest version at any time during your one year and we are always here to help! Yearly maintenance after the 1<sup>st</sup> year is only \$399.

***By combining the impressive analysis of DART with the powerful extraction ability of the Oxygen Extractor, we have created the most COMPLETE Cell Phone Solution Tool EVER!***

**Features:**

**Support for over 9,000 phones, including Chinese Devices**

**Android, Apple, Blackberry, Symbian, Windows 8, Windows 5/6, Chinese (MTK)**

**Seamless importing into DART for full analytics and reporting**

**SIM Card support**

**Includes HTCI Android Ripping Tool (ART)**
